

How Air Selangor Has Implemented IoT Devices Into Their Workplace

What Companies Can Learn From Air Selangor — Implementing IoT Technologies

Like everything on earth, our water sources such as lakes, rivers, oceans, and the water cycle itself will be heavily affected by the recent climate change.

As climate change continues to be one of our biggest challenges, it has also served as a reminder of how interconnected everything is and how organizations responsible for protecting our waterways must be aware of the impact of climate change on water availability and sustainability.

Over the years, [Pengurusan Air Selangor Sdn Bhd](#) (Air Selangor) has embarked on a digital transformation journey by implementing IoT devices to drastically change the workplace for their people and business performance.

Thus, here are some of the digital strategies Air Selangor has brought in, from data analytics to remote sensing, to transform their business into a digital utility.

Empowering Consumers Through A Rich Digital Experience

The amount of connected devices is growing every day, so mobile applications act as mediators between IoT devices and people.

In this day and age, mobile apps are at the frontier of IoT because our smartphones are always at hand, and IoT technologies keep people informed while saving time. For many individuals, mobile IoT apps help give them control over their homes and help manage their daily routine.

However, for a company such as Air Selangor, mobile applications help regulate IoT devices to ensure control over an entire area. Thus, leading to their launch of the 'Air Selangor' mobile app in 2018.

In order to ensure the best customer experience, the app offers a multitude of features that will provide consumers with the latest news on water supply updates, bill details, as well as an easy payment gateway.

By introducing this mobile IoT app, they could achieve all that while also reducing energy and optimizing city infrastructures.

Big Data Analytics Is The New Game Changer

As Malaysia's largest water operator with a combined capacity of 5,000 million liters per day, keeping up with technological advancements and data trends is vital to increasing Air Selangor's ability to deliver tremendous results.

For years, Air Selangor has only relied on manual processes in order to collect and analyze their big sum of data, which is no longer adequate for any major companies nowadays that are producing data in a much higher volume.

Hence, to build enterprise-wide capabilities for big data analytics, Air Selangor sets up the Data Analytics Centre (DAC) to fully harness the potentials of their data by building, maximizing, and upscaling the capabilities of end-to-end big data analytics.

These data points in the water utility industry include artificial intelligence, machine learning, and digitalization of intelligence. Thus, easing their decision-making process, drafting policies, optimizing their cost, and increasing overall efficiency.

Digitalization & Remote Monitoring of Operations

[According to Forbes](#), the IoT market is predicted to double in 2021, making it an emerging technology that organizations noted as worthy of investment.

With that, let's talk about the remote monitoring industry that enables you to collect data from your network or monitor your devices and equipment faster and better. By introducing IoT into the mix, it means that you don't have to be right there on-site to keep the operation running.

In 2019, Air Selangor introduced the new Intelligent Command Centre (ICC) as one of its key drivers to becoming a digital water utility.

The purpose of the ICC is to link and integrate strategic asset parameters such as flow, pressure, pump status, reservoir level, and supervisory control and data acquisition (SCADA) capabilities—from wherever and at any time.

Whatever you're trying to monitor, it's crucial to avoid any costs that may come with manual monitoring. Thus, IoT devices provide the perfect solution to mitigate these issues.

Mobilizing The Digital Future Of Water

Utilities were among the first IoT adopters, with smart metering at the center of that growth, aiding utility providers to optimize energy distribution and improve energy efficiency.

While utility meters have been around for years, adding remote sensors on them is what makes them “smart” meters. Another digital solution that Air Selangor has invested in is the Advanced Metering Infrastructure (AMI) Smart Water Meter provide, which provides real-time information to better management and meter reading for billing purposes.

Another step towards a fully digital water utility is their Automatic Secondary Chlorination System (ASCS), a smart system that uses internet-of-things technology to detect Free Residual Chlorine (FRC) levels at the water distribution system.

These are some of the many wireless technologies Air Selangor has implemented to ensure consumers are receiving safe and clean-treated water while also removing the need for manual operations.

IoT Trend Is Associated With Changing Lives For The Better

As more and more organizations shift toward a more digital transformation by adopting new technologies, it has enabled them to explore better solutions through the application of big data, artificial intelligence (AI), workforce mobility, and more.

By adapting into a digitally transformed organization, companies or utility providers can enjoy cost savings, increased efficiency, operational reliability, better decision-making process, increased public safety, and of course, empower customer experience through a rich digital experience.
